

ENVERGE SPRAY FOAM IS THE PERFECT SOLUTION FOR INSULATING YOUR POLE BARN OR METAL BUILDING

Air escape or entry in a pole barn can cause energy loss, moisture issues, inconsistent temperatures, and pest intrusion, compromising efficiency and durability. Enverge spray foam insulation fills irregular spaces, adheres to metal surfaces, and creates an airtight seal, reducing air leakage while enhancing energy efficiency, moisture control, and durability.

COMMON LOCATIONS FOR AIR ENTRY OR ESCAPE

1. Poorly sealed ridge caps or gaps along the roofline
2. Gaps where the walls meet the roof, and sealed soffits or eaves
3. Gaps at the base of the walls where they meet the foundation or floor.
4. Air can enter and escape through roll up, sliding, and hinged doors.
5. Screws or fasteners that are loose or have lost their sealing washers
6. Ventilation features may inadvertently allow air entry or escape if not properly managed or sealed.
7. Areas where pipes, wires, or other utilities penetrate the structure can develop air gaps if not properly sealed.
